Mathews Conquest 2

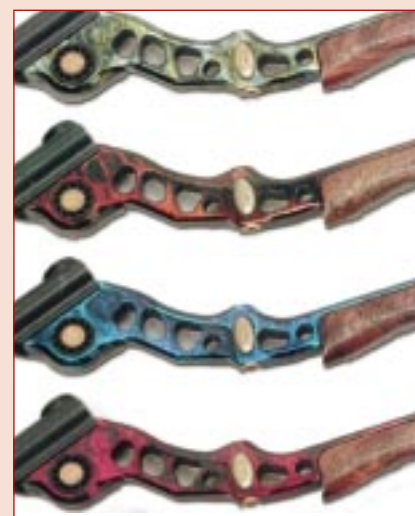

The Conquest 2 has impressive heritage, it's predecessor, the Conquest Pro, won more money on the tournament circuits than any other bow. Conquest 2 combines the long handle/short limb design with Mathews' revolutionary Harmonic Damping System. The end result is the most comfortable, most accurate bow available today.

Morgan Lundin world champion field and indoor, world record holder.

Mathews Q2XL

This bow created more demand than any other bow in Europe last year. Its long handle with short, almost parallel limbs make this bow extremely stable. Combined with the perimeter-weighted one-cam and the innovative Harmonic Dampers it is a sensation to shoot. Experience almost vibration-free shooting. Morgan Lundin from Sweden became world champion Field in 2000 and world champion indoor in 2001 shooting his Mathews Q2XL. He also set a world record indoor showing the allround shooting qualities of this bow.

Mathews Ultra-2

Archers looking for a faster bow with less recoil will find an excellent choice in the new Ultra-2. Mathew's Harmonic Dampening System is now standard on this bow. It is the fastest Mathews bow in the new 2001 series. The new marbled colors will make you stand out in any 3D tournament.

Mathews FX

Mathews quality at a very moderate price point. The FX is a bow that combines 7 1/2" brace height, light weight, maneuverability and hard-hitting accuracy. In addition to the original MaxCam the FX includes the new, slimmer competition grip.

Mathews, quickly becoming the biggest bow company in the world.

Mathews has become so popular in a relative short period that it has been the fastest growing bow company in the world for a number of years now. Innovative design has made Mathews the no. 1 compound bow company in the world.

Mathews, the inventor of single-cam technology

Matt McPherson, founder of Mathews, invented the single-cam which has since then revolutionized the archery world. A single cam is not affected by wheel timing problems as with two-cam bows. It is easier in tuning and is easy to hold at full draw because there aren't two cams "fighting" each other.

Perimeter-Weighted Technology

The inventor of single-cam technology came up with another Mathews innovation. A tungsten carbide Inertia Disc is strategically placed on the perimeter of the cam. As the bow limbs fire, the Inertia Disc catapults in the opposite direction, counteracting limb momentum and resulting in dramatically decreased recoil and noise.

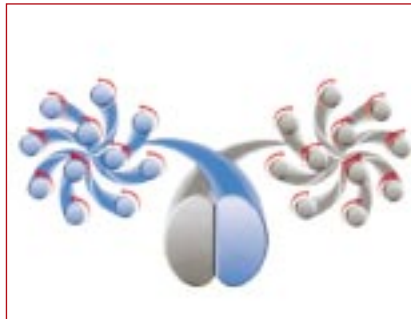

Lightweight design

Mathews bows are lighter than most other bows making them more comfortable to hold and aim. Weight conscious design created the lightest bows possible.

No peep rotation

All Mathews bows feature Zebra ZS bowstrings. It combines bundles of multi-filament strands counter-twisted to form the best balanced bowstring available. Experience a bowstring with virtually no peep rotation.

Mathews, the most comfortable bows in the world

The almost-parallel limb design of Mathews results in reduced recoil that should be experienced. Harmonic dampening further reduces vibrations. Floating in elastic bushings located at key riser locations, Harmonic Dampers create "weight-in-motion" which disrupts and dampens shot vibration and noise.

Harmonic dampers in elastic bushings-house which are removable and interchangeable and which absorb excess recoil vibration.

Long riser/short limb design - results in more stability and higher accuracy.

Ball-bearing Idler Wheel.
